StoreLocator

Step 1: Summary of the Client Request

The client would like to add a **Store Locator feature** to their website.

This feature should allow customers to:

- Enter their location (city, postcode, or allow GPS access)
- Find the nearest store(s)
- View store details (address, phone number, opening hours)
- Easily use the feature on mobile devices

The goal is to make it simple for customers to quickly locate the nearest physical store in a user-friendly and mobile-responsive way.

Step 2: Proposed Store Locator Components

When asking, *"What components would a Store Locator website feature need?"*, the following functional parts were identified:

1. User Input Field

- Text field for postcode, city, or address
- Optional "Use My Location" GPS button

2. Location Detection

- Browser geolocation API
- IP-based fallback (optional)

3. Store Database

- List of store locations
- Address
- Latitude & longitude
- Phone number
- Opening hours

4. Distance Calculation Logic

- JavaScript to calculate distance between user and store
- Haversine formula or map API distance tools

5. Results Display

- List of closest stores
- Sorted by distance

- Clickable for more details

6. Interactive Map (Optional but Recommended)

- Google Maps or similar map API
- Pins for store locations
- Clickable store markers

7. Mobile Responsiveness

- Flexible layout
- Large tap-friendly buttons
- Clear readable text

8. Error Handling

- No stores found message
- Invalid postcode message
- Location permission denied message

Step 3: Code Examples (Mobile-Friendly)

Below are simple example snippets.

Example 1: Basic HTML Structure

```
<!DOCTYPE html>
<html>
<head>
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <title>Store Locator</title>
 <style>
  body {
   font-family: Arial, sans-serif;
   padding: 15px;
  }
  input, button {
   width: 100%;
   padding: 12px;
   margin-top: 10px;
   font-size: 16px;
  }
  .store {
   border: 1px solid #ddd;
   padding: 10px;
   margin-top: 10px;
   border-radius: 5px;
```

```
  }
 </style>
</head>
<body>

<h2>Find a Store Near You</h2>

<input type="text" id="locationInput" placeholder="Enter your postcode">
<button onclick="findStore()">Search</button>

<div id="results"></div>

</body>
</html>
```

Why This Works:

- Mobile responsive (viewport meta tag)
- Full-width input and buttons
- Clean and simple layout
- Easy to expand with JavaScript logic

Step 4: UI Suggestions

When asking, *"What would a simple and user-friendly interface look like for a store locator?"*, the following design approach was suggested:

Layout Description

Top Section:

- Clear heading: "Find a Store Near You"
- Short instruction text
- Location input field
- "Use My Location" button
- "Search" button

Middle Section:

- Interactive map (optional)
- Pins showing store locations

Bottom Section:

- List of nearest stores
- Each store card includes:
    - Store name (bold)

    - Address
    - Phone number
    - Opening hours
    - “Get Directions” button

Design Style Recommendations:

- Clean white background
- Brand color for buttons
- Rounded buttons for modern look
- Large tap-friendly elements
- Clear spacing between store cards

Mobile View:

- Vertical stacked layout
- Full-width buttons
- Scrollable results
- Map collapses above results for smaller screens

This ensures the feature is simple, accessible, and easy for non-technical users.

Step 5: Client Summary Email Draft

Below is a professional email Maya could send:

Subject: Store Locator Feature Proposal

Dear [Client Name],

I hope you're doing well.

Following your request for a Store Locator feature, I’ve outlined a proposed structure for how this could be implemented on your website.

The feature would allow users to enter their postcode or use their current location to find the nearest store. Results would display clearly in a mobile-friendly format, including store address, contact details, opening hours, and optional map directions.

Key components would include:

- Location input and GPS detection
- Store database with structured location data
- Distance-based store matching
- Mobile-responsive results display

- Optional interactive map integration

The design approach focuses on simplicity and usability, ensuring customers can quickly find their nearest store with minimal effort.

Please let me know if you would like:

- Basic version (search + list results)
- Advanced version (map integration + distance sorting)
- Ongoing support and future scalability options

I'd be happy to discuss next steps and timelines with you.

Kind regards,
Maya
